

Filamentary transport in high-power H-mode conditions and in no/small-ELM regimes to predict heat and particle loads on PFCs for future devices

J. Madsen and N. Vianello

15 November 2016

This work has been carried out within the framework of the EUROfusion Consortium and has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 633053. The views and opinions expressed herein do not necessarily reflect those of the European Commission.

- I. Recent experimental and theoretical investigation agrees on suggesting SOL density profiles is determined by a balance between radial convective filamentary transport and parallel dynamics

1. Recent experimental and theoretical investigation agrees on suggesting SOL density profiles is determined by a balance between radial convective filamentary transport and parallel dynamics
2. The balance is observed to change at high density in L-Mode and this is at the basis of the *shoulder formation*

1. Recent experimental and theoretical investigation agrees on suggesting SOL density profiles is determined by a balance between radial convective filamentary transport and parallel dynamics
2. The balance is observed to change at high density in L-Mode and this is at the basis of the *shoulder formation*
3. This is observed in a variety of devices including AUG (Carralero *et al.* 2014), TCV (Garcia *et al.* 2007) and MAST (Militello *et al.* 2016)

5. The H-Mode behavior is still a work in progress and exhibit a dependence on the level of **fueling**
6. L-Mode and H-Mode behavior are not yet reconciled and different devices show somehow contradictory behavior

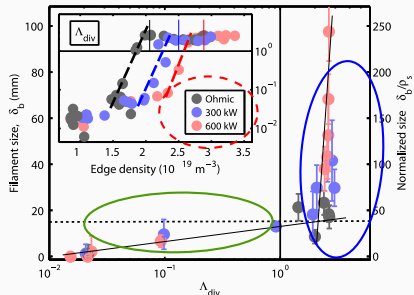

- ✓ AUG and JET (Carralero *et al.* 2015) suggest that Λ_{div} dominates this process and a transition from sheath-limited to inertial regime

- ✓ AUG and JET (Carralero *et al.* 2015) suggest that Λ_{div} dominates this process and a transition from sheath-limited to inertial regime
- ✓ Tested by changing n_e and T_e through fueling/seeding/heating

- ✓ AUG and JET (Carralero *et al.* 2015) suggest that Λ_{div} dominates this process and a transition from sheath-limited to inertial regime
- ✓ Tested by changing n_e and T_e through fueling/seeding/heating
- ✓ This determines a change of the velocity-size scaling
